

Detailed feature comparison

Professional and Enterprise editions, with a planned free evaluation. This preliminary comparison is subject to release validation; purchasing and downloads are not open yet.

How to read this list

Planned identifies the proposed free demo. **Yes** identifies an intended paid-edition capability, subject to supported file formats, credentials, policy and retained data. A dash means the capability is outside that offering.

Discovery and everyday protection

Capability	Free demo (planned)	Paid Professional	Paid Enterprise
Scan supported Office files and folders	Planned	Yes	Yes
Discover ZIP members, including nested ZIPs	Planned	Yes	Yes
Validate passwords supplied by the user	Planned	Yes	Yes
List eligible files on File Actions	Planned	Yes	Yes
Locate selected files in Windows Explorer	Planned	Yes	Yes
Set, change or remove VBA project passwords	-	Yes	Yes
Change supported viewing-lock and Viewable/Unviewable state	-	Yes	Yes
Apply supported changes to ZIP members	-	Yes	Yes
Review temporary proposed changes before finalizing	-	Yes	Yes
Remove compiled VBA p-code where supported	-	Yes	Yes
Search VBA code [1]	-	Yes	Yes
Store and reuse verified passwords in an encrypted vault	-	Yes	Yes
Retain supported protection-change history and rollback data	-	Yes	Yes
Recover or merge eligible existing Macro Lockset data	-	Yes	Yes

[1] Search is being redesigned. Its detailed behavior will be described at release.

[2] Changing existing protection in Professional requires confirmation of the applicable current password, supplied by you or available from a usable vault. VBA project protection is separate from document-opening encryption.

Enterprise controls

Professional capabilities, plus separate administration and organization controls. Administrators do not occupy user seats and cannot approve their own requests. Enterprise requires Administrator-first setup and a suitable shared organization store.

Capability	Free demo (planned)	Paid Professional	Paid Enterprise
Named users and device enrollment	-	-	Yes
Separate Administrator roles and individual enrollment	-	-	Yes
Contracted user capacity, person reassignment and multiple Admins	-	-	Yes
Per-user permissions and saved-vault availability periods	-	-	Yes
Per-user validation policy for authorized Search	-	-	Yes
Exact-file exception requests and recorded decisions	-	-	Yes
Approval expiry, revocation and consumption controls	-	-	Yes
Organization file metadata and validation-evidence views	-	-	Yes
Actor-attributed configuration and decision history	-	-	Yes
Encrypted corporate vault backup and authorized IT handoff	-	-	Yes
Policy-enabled, approved nonstandard conversion	-	-	Yes
Interrupted-operation tracking and reconciliation	-	-	Yes
Protected deployment configuration and seated setup export	-	-	Yes

Exact-file approvals are governed by organizational policy, separate Administrator authority and supported operations. Approval does not repair damaged files or replace filesystem permissions.

Encrypted vault handoff requires explicit organization authorization and the applicable IT key established before the relevant backup. Vault contents are not automatically inherited.

Additional capabilities

The following capabilities are planned for the paid editions. Their inclusion in the unactivated demo has not been decided.

Capability	Free demo (planned)	Paid Professional	Paid Enterprise
Advanced scan controls and exclusions	TBD	Yes	Yes
Exact-duplicate grouping	TBD	Yes	Yes
Session statistics and scan history	TBD	Yes	Yes
Pending-file recheck	TBD	Yes	Yes
Startup PIN	TBD	Yes	Yes
Ribbon XML details	TBD	Yes	Yes

Install, evaluate, activate

The planned free evaluation uses the unactivated Professional application: scan, validate supplied passwords and locate files in Explorer, without file changes or VBA code Search. Enterprise prospects may evaluate shared features this way. Enterprise seated installation still requires prior Administrator setup.

Supported files and formats

Scanning, reading VBA source and applying changes have different format support. Identification in scan results does not mean every operation is available. Compiled Access files may be identified without editable source. Outlook OTM changes require Outlook to be closed. ZIP and nested ZIP handling is subject to archive limits.

History and rollback

Rollback requires usable retained data and keys. It restores the applicable prior state, not subsequent document edits. P-code-only removal does not create a permanent Rollback Macro Project checkpoint.

Files and registration

The planned registration exchange is separate from local file processing and does not include Office documents, VBA source or vault passwords. Enterprise organizational functions use the customer organization store.

Availability

Pricing, supported system requirements, license terms and download availability will be published before purchasing opens. Product registration, activation and the unactivated evaluation experience require final release validation.
